
QUARTERLY REPORT ON HOUSEHOLD DEBT AND CREDIT

Household Debt and Credit Developments in 2010Q2¹

Aggregate consumer debt continued to decline in the second quarter, continuing its trend of the previous six quarters. As of June 30, 2010, total consumer indebtedness was \$11.7 trillion, a reduction of \$812 billion (6.5%) from its peak level at the close of 2008Q3, and \$178 billion (1.5%) below its March 31, 2010 level.² Household mortgage indebtedness has declined 6.4%, and home equity lines of credit (HELOCs) have fallen 4.4% since their respective peaks in 2008Q3 and 2009Q1. Excluding mortgage and HELOC balances, consumer indebtedness fell 1.5% in the quarter and, after having fallen for six consecutive quarters, stands at \$2.31 trillion, 8.4% below its 2008Q4 peak.

The number of open credit accounts continued to decline, although at a somewhat slower rate, during the quarter. About 272 million credit accounts were closed during the four quarters that ended June 30, while 161 million accounts were opened. The number of credit account inquiries within six months – an indicator of consumer credit demand – ticked up for the first time since 2007Q3. Credit cards have been the primary source of the reductions in accounts over the past two years, and during 2010Q2 the number of open credit card accounts fell from 385 to 381 million. Still, the number of open credit card accounts on June 30 was down 23.2% from their 2008Q2 peak.

For the first time since early 2006, total household delinquency rates declined in 2010Q2. As of June 30, 11.4% of outstanding debt was in some stage of delinquency, compared to 11.9% on March 31, and 11.2% a year ago. Currently about \$1.3 trillion of consumer debt is delinquent and \$986 billion is seriously delinquent (at least 90 days late or “severely derogatory”). Delinquent balances are now down 2.9% from a year ago, but serious delinquencies are up 3.1%.

About 496,000 individuals had a foreclosure notation added to their credit reports between March 31 and June 30, an 8.7% increase from the 2010Q1 level of new foreclosures. New bankruptcies noted on credit reports rose over 34% during the quarter, from 463,000 to 621,000. While we usually see jumps in the bankruptcy rate between the first and second quarter of each year, the current increase is higher than in the past few years, when it was around 20%.

Mortgage originations fell another 4.1% between 2010Q1 and 2010Q2, to \$364 billion. While mortgage originations in 2010Q2 were 20.6% above their 2008Q4 trough, they remain more than 50% below their average levels of 2003-2007. Auto loan originations rose sharply – 25% – in the second quarter, and were nearly 32% above their trough levels of 2009Q1. Still, auto loan origination balances remain well below their levels of 2005-2006.

About 2.6% of current mortgage balances transitioned into delinquency during 2010Q2, continuing the decline in this measure observed over the last year. Transitions from early (30-60 days) into serious (90 days or more) delinquency improved sharply in 2010Q2, falling from 39% to 33%, the lowest rate of deterioration since 2008Q2. Nonetheless, despite recent improvements in this rate and the “cure” rate – transitions from delinquency to current status, which rose to nearly 30% – both remain at very unfavorable levels by pre-crisis standards.

While many of the national trends described here are present in most areas of the country, the data for selected states and for the twelve Federal Reserve Districts indicate substantial heterogeneity. For example, data for Arizona, California, Florida and Nevada continue to indicate higher than average delinquency and foreclosure rates. The accompanying charts provide graphic representations of the national data and, for selected series, the underlying geographic variation.

¹ This report is based on data from the FRBNY Consumer Credit Panel. Please contact Andrew Haughwout, Wilbert van der Klaauw or Donghoon Lee with questions.

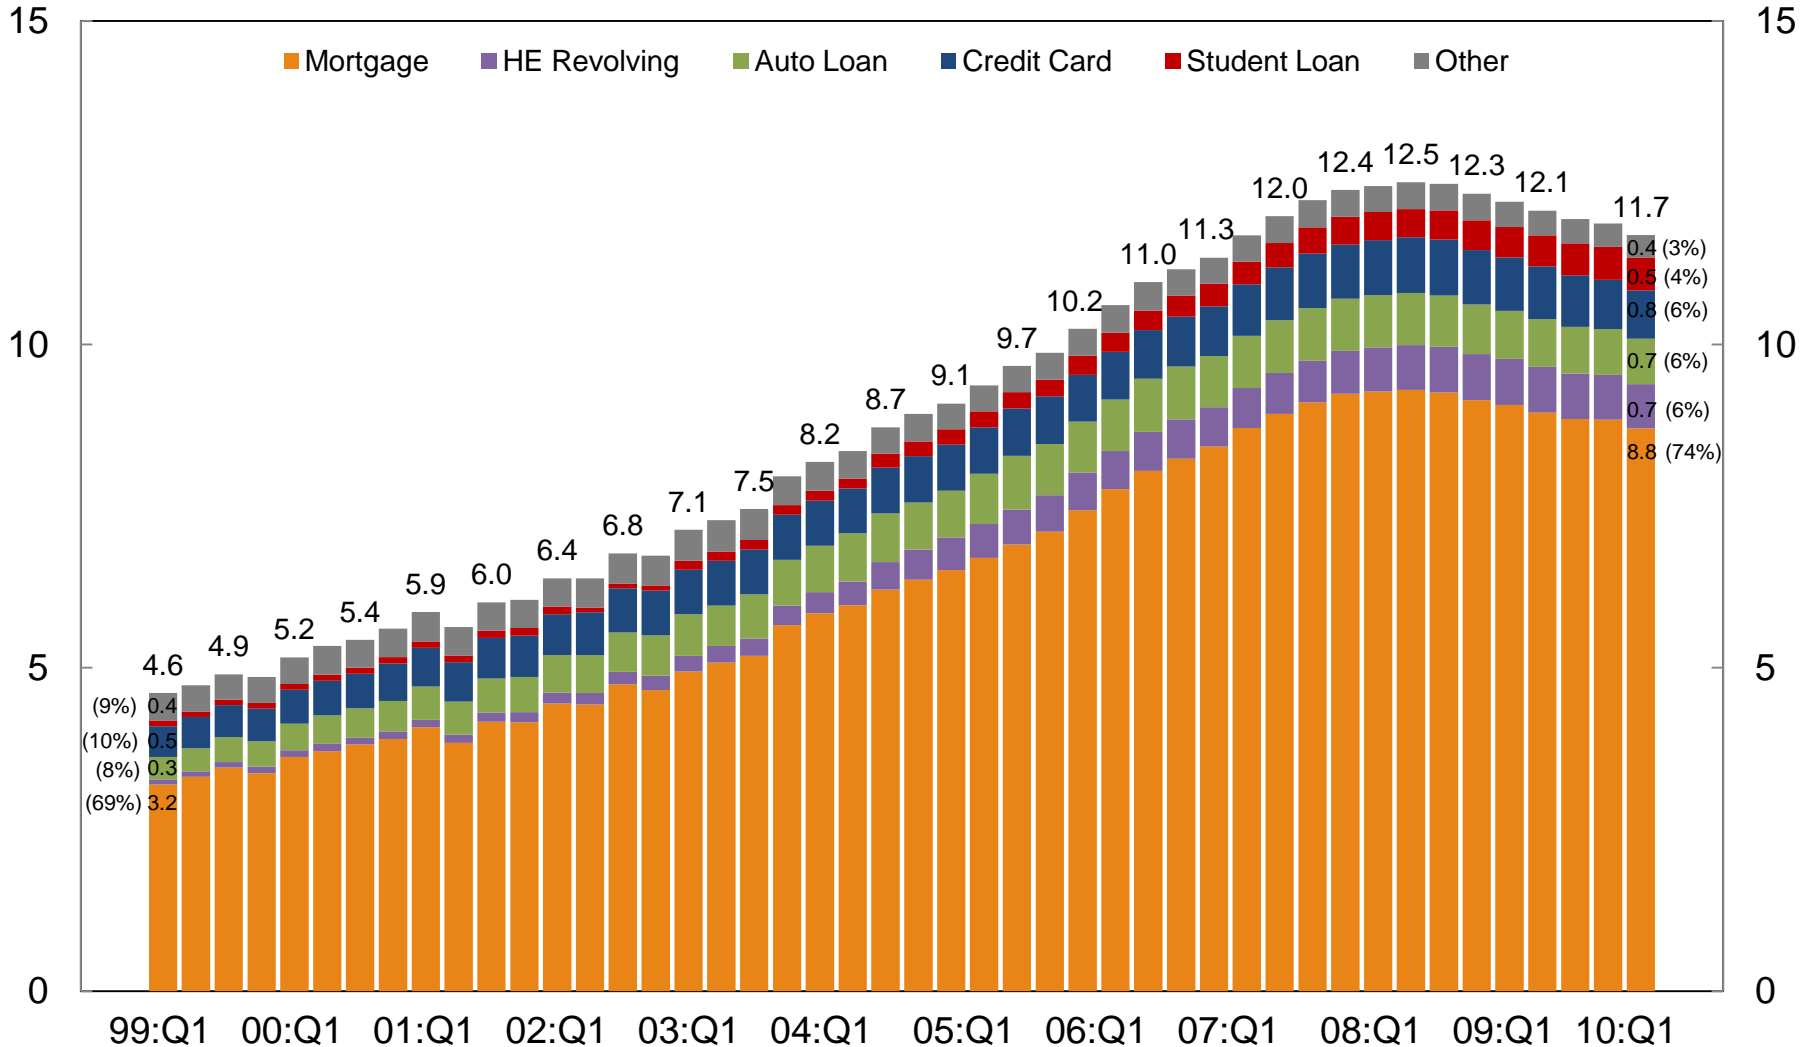

² For details on the data set and the measures reported here, see the data dictionary that follows the charts.

Data Dictionary

The FRBNY Consumer Credit Panel consists of detailed Equifax credit-report data for a unique longitudinal quarterly panel of individuals and households from 1999 to 2009. The panel is a nationally representative 5% random sample of all individuals with a social security number and a credit report (usually aged 19 and over). We also sampled all other individuals living at the same address as the primary sample members, allowing us to track household-level credit and debt for a random sample of US households. The resulting database includes approximately 40 million individuals in each quarter. More details regarding the sample design can be found in Lee and van der Klaauw (in progress).¹ A comprehensive overview of the specific content of consumer credit reports is provided in Avery, Calem, Canner and Bostic (2003).²

The credit report data in our panel primarily includes information on accounts that have been reported by the creditor within 3 months of the date that the credit records were drawn each quarter. Thus, accounts that are not currently reported on are excluded. Such accounts may be closed accounts with zero balances, dormant or inactive accounts with no balance, or accounts that when last reported had a positive balance. The latter accounts include accounts that were either subsequently sold, transferred, or paid off as well as accounts, particularly derogatory accounts, that are still outstanding but on which the lender has ceased reporting. According to Avery et al (2003), the latter group of noncurrently reporting accounts, with positive balances when last reported, accounted for approximately 8% of all credit accounts in their sample. For the vast majority of these accounts, and particularly for mortgage and installment loans, additional analysis suggested they had been closed (with zero balance) or transferred.³ Our exclusion of the latter accounts is comparable to some 'stale account rules' used by credit reporting companies, which treat noncurrently reporting revolving and nonrevolving accounts with positive balances as closed and with zero balance.

All figures shown in the tables and graphs are based on the 5% random sample of individuals. To reduce processing costs, we drew a 2% random subsample of these individuals, meaning that the results presented here are for a 0.1% random sample of individuals with credit reports, or approximately 240,000 individuals as of Q4 2009.⁴ In computing several of these statistics, account was taken of the joint or individual nature of various loan accounts. For example to minimize biases due to double counting, in computing individual-level total balances, 50% of the balance associated with each joint account was attributed to that individual. Per-capita figures are computed by dividing totals for our sample by the total number of people in our sample, so these figures apply to the population of individuals who have a credit report.

In comparing aggregate measures of household debt presented in this report to those included in the Board of Governor's Flow Of Funds (FoF) Accounts, there are several important considerations. First, among the different components included in the FoF household debt measure (which also includes debt of nonprofit organizations), our measures are directly comparable to two of its components: home mortgage debt and consumer credit. Total mortgage debt and non-mortgage debt in the third quarter of 2009 were respectively \$9.7 and \$2.4 trillion, while the comparable amounts in the FoF for the same quarter were \$10.3 and \$2.5 trillion, respectively.⁵ Second, a detailed accounting for the remaining differences between the debt measures from both data sources will require a more detailed breakdown and documentation of the computation of the FoF measures.⁶

² Avery, R.B., P.S. Calem, G.B. Canner and R.W. Bostic, "An Overview of Consumer Data and Credit Reporting", Federal Reserve Bulletin, Feb. 2003, pp 47-73.

³ Avery et al (2003) found that for many nonreported mortgage accounts a new mortgage account appeared around the time the account stopped being reported, suggesting a refinance or that the servicing was sold. Most revolving and open non-revolving accounts with a positive balance require monthly payments if they remain open, suggesting the accounts had been closed. Noncurrently reporting derogatory accounts can remain unchanged and not requiring updating for a long time when the borrower has stopped paying and the creditor may have stopped trying to collect on the account. Avery et al report that some of these accounts appeared to have been paid off.

⁴ Due to relatively low occurrence rates we used the full 5% sample for the computation of new foreclosure and bankruptcy rates. For all other graphs, we found the 0.1% sample to provide a very close representation of the 5% sample.

⁵ Flow of Funds Accounts of the United States, Flows and Outstandings, Third Quarter 2009, Board of Governors, Table L.100.

⁶ Our debt totals exclude debt held by individuals without social security numbers. Additional information provided by Equifax suggests that total debt held by such individuals is relatively small and accounts for little of the difference.

Loan types. In our analysis we distinguish between the following types of accounts: mortgage accounts, home equity revolving accounts, auto loans, bank card accounts, student loans and other loan accounts. *Mortgage accounts* include all mortgage installment loans, including first mortgages and home equity installment loans (HEL), both of which are closed-end loans. *Home Equity Revolving accounts* (aka Home Equity Line of Credit or *HELOC*), unlike home equity installment loans, are home equity loans with a revolving line of credit where the borrower can choose when and how often to borrow up to an updated credit limit. *Auto Loans* are loans taken out to purchase a car, including Auto Bank loans provided by banking institutions (banks, credit unions, savings and loan associations), and Auto Finance loans, provided by automobile dealers and automobile financing companies. *Bankcard accounts* (or credit card accounts) are revolving accounts for banks, bankcard companies, national credit card companies, credit unions and savings & loan associations. *Student Loans* include loans to finance educational expenses provided by banks, credit unions and other financial institutions as well as federal and state governments.⁷ The *Other* category includes Consumer Finance (sales financing, personal loans) and Retail (clothing, grocery, department stores, home furnishings, gas etc) loans.

Our analysis excludes authorized user trades, disputed trades, lost/stolen trades, medical trades, child/family support trades, commercial trades and, as discussed above, inactive trades (accounts not reported on within the last 3 months).

Total debt balance. Total balance across all accounts, excluding those in bankruptcy.

Number of open, new and closed accounts. Total number of open accounts, number of accounts opened within the last 12 months. Number of closed accounts is defined as the difference between the number of open accounts 12 months ago plus the number of accounts opened within the last 12 months, minus the total number of open accounts at the current date.

Inquiries. Number of credit-related consumer-initiated inquiries reported to Equifax in the past 6 months. Only 'hard pulls' are included, which are voluntary inquiries generated when a consumer authorizes lenders to request a copy of their credit report. It excludes inquiries made by creditors about existing accounts (for example to determine whether they want to send the customer pre-approved credit applications or to verify the accuracy of customer-provided information) and inquiries made by consumers themselves. Within each industry of auto finance, mortgage, and utilities (excluding wireless), multiple inquiries in 30-day periods count as one inquiry. Note that inquiries are credit reporting company specific and not all inquiries associated with credit activities are reported to Equifax. Moreover, the reporting practices for the credit reporting companies may have changed during the period of analysis.

High credit and balance for credit cards. Total amount of high credit on all credit cards held by the consumer. High credit is either the credit limit, or highest balance ever reported during history of this loan. As reported by Avery et al (2003) the use of the highest-balance measure for credit limits on accounts in which limits are not reported likely understates the actual credit limits available on those accounts.

High credit and balance for HE Revolving. Same as for credit cards, but now applied to HELOCs.

Credit utilization rates (for revolving accounts). Computed as proportion of available credit in use (outstanding balance divided by credit limit), and for reasons discussed above are likely to overestimate actual credit utilization.

Delinquency status. Varies between current (paid as agreed), 30-day late (between 31 and 60 day late; not more than 2 payments past due), 60-day late (between 61 and 90 days late; not more than 3 payments past due), 90-day late (between 91 and 120 days late; not more than 4 payments past due), 120-day late (at least 121 days past due; 5 or more payments past due) or collections, and severely derogatory (any of the previous states combined with reports of a repossession, charge off to

⁷ The student loan delinquency rates shown in Figure 6 reveal a more volatile pattern and an overall higher delinquency rate prior to 2003, which may reflect a change in reporting behavior where lenders previously may not have reported on loans on which repayment may have been deferred for a period of time (see Avery et al, 2003).

bad debt or foreclosure). Not all creditors provide updated information on payment status, especially after accounts have been derogatory for a longer period of time. Thus the payment performance profiles obtained from our data may to some extent reflect reporting practices of creditors.

Percent of balance 90+ days late. Percent of balance that is either 90-day late, 120-day late or severely derogatory. 90+ days late is synonymous to seriously delinquent.

New foreclosures. Number of *individuals* with foreclosures first appearing on their credit report during the past 3 months. Based on foreclosure information provided by lenders (account level foreclosure information) as well as through public records. Note that since borrowers may have multiple real estate loans, this measure is conceptually different from foreclosure rates often reported in the press. For example, a borrower with a mortgage currently in foreclosure would not be counted here if he receives a foreclosure notice on an additional mortgage account. In the case of joint mortgages, both borrowers' reports indicate the presence of a foreclosure notice in the last 3 months, and both are counted here.

New bankruptcies. New bankruptcies first reported during the past 3 months. Based on bankruptcy information provided by lenders (account level bankruptcy information) as well as through public records.

Collections. Number and amount of 3rd party collections (i.e. collections not being handled by original creditor) on file within the last 12 months. Includes both public record and account level 3rd party collections information. As reported by Avery et al (2003), only a small proportion of collections are related to credit accounts with the majority of collection actions being associated with medical bills and utility bills.

Equifax Risk Score. Credit score computed by Equifax's credit scoring model. The Equifax Risk ScoreSM, like the FICO[®] score, ranges from 300-850, with a higher score being viewed as a better risk than someone with a lower score.

New (seriously) delinquent balances and transition rates. New (seriously) delinquent balance reported in each loan category. For mortgages, this is based on the balance of each account at the time it enters (serious) delinquency, while for other loan types it is based on the net increase in the aggregate (seriously) delinquent balance for all accounts of that loan type belonging to an individual. **Transition rates.** The transition rate is the new (seriously) delinquent balance, expressed as a percent of the previous quarter's balance that was not (seriously) delinquent.

Newly originated installment loan balances. We calculate the balance on newly originated mortgage loans as they first appear on an individual's credit report. For auto loans we compare the total balance and number of accounts on an individual credit report in consecutive quarters. New auto loan originations are then defined as increases in the balance accompanied by increases in the number of accounts reported.
